LibGen is a unique concept in the category of eBooks, as this Russia based website is actually a search engine that helps you download books and articles related to science. It allows you to download paywalled content for free including PDF downloads for the stuff on Elsevier's Science Direct website. Even though the site continues to face legal issues due to the pirated access provided to books and articles, the site is still functional through various domains.

### An Introduction To Galois Theory

Article by Dan Goodman. Published February 2002, February 2011. This is a short introduction to Galois theory. The level of this article is necessarily quite high compared to some NRICH articles, because Galois theory is a very difficult topic usually only introduced in the final year of an undergraduate mathematics degree.

AN INTRODUCTION TO GALOIS THEORY STEVEN DALE CUTKOSKY In these notes we consider the problem of constructing the roots of a polynomial. Sup-pose that  $F$  is a subfield of the complex numbers, and  $f(x)$  is a polynomial over  $F$ . We wish to give a rational formula for constructing the roots of  $f(x)$ . The quadratic formula is an example of such a formula.

If  $p$  is a prime number, then it is also possible to define a field with  $p^m$  elements for any  $m$ . These fields are named for the great French algebraist Evariste Galois who was killed in a duel at age 20. They have many applications in coding theory. The fields, denoted  $\text{GF}(p^m)$ , are comprised of the polynomials of degree  $m-1$  over the field

Actually, to reach his conclusions, Galois kind of invented group theory along the way. In studying the symmetries of the solutions to a polynomial, Galois theory establishes a link between these two areas of mathematics. We illustrate the idea, in a somewhat loose manner, with an example. The symmetries of the solutions to  $x^3 - 2 = 0$ .

Introduction to Galois Theory The aim of Galois theory is to study the solutions of polynomial equations  $f(x) = a_n x^n + \dots + a_0 = 0$  and, in particular, to distinguish those that can be solved by a formula from those that cannot. By formula we mean a radical expression, anything that can be built up from the coefficients  $a_i$

In this presentation of the Galois correspondence, modern theories of groups and fields are used to study problems, some of which date back to the ancient Greeks. The techniques used to solve these problems, rather than the solutions themselves, are of primary importance. The ancient Greeks were concerned with constructibility problems.
