Solution: We assume that there are at least 2 elements in the array; otherwise, the problem is ill-defined. Further, we assume that the number of elements in A is an exact power of 2, in order to simplify the exposition. Algorithm 1.2 represents a Divide-And-Conquer approach for computing both the minimum and maximum elements of the input array.

Algorithm 1 LINEAR-SEARCH(A;v) Input:  $A = \langle a_1; a_2; \dots; a_n \rangle$  and a value  $v$ . Output: An index  $i$  such that  $v = A[i]$  or nil if  $v \notin A$  for  $i = 1$  to  $n$  do if  $A[i] = v$  then return  $i$  end if end for return nil As a loop invariant we say that none of the elements at index  $A[1; \dots; i - 1]$  are equal to  $v$ . Clearly, all properties are fulfilled by this loop invariant. 2:2-1

Express the maximum number of operations, the algorithm performs in terms of  $n$ . Eliminate all excluding the highest order terms. Remove all the constant factors. Some of the useful properties on Big-O notation analysis are as follow: If  $f(n) = c \cdot g(n)$ , then  $O(f(n)) = O(g(n))$ ; where  $c$  is a nonzero constant.
