### F1 Rocket Engine

The F-1 is a gas generator-cycle rocket engine developed in the United States by Rocketdyne in the late 1950s and used in the Saturn V rocket in the 1960s and early 1970s. Five F-1 engines were used in the S-IC first stage of each Saturn V, which served as the main launch vehicle of the Apollo program. The F-1 remains the most powerful single combustion chamber liquid-propellant rocket engine ...

### Rocketdyne F-1 - Wikipedia

The F-1 engine - the most powerful single-nozzle, liquid-fueled rocket engine ever developed - boosted the Saturn V rocket off the launch pad and on to the moon during NASA's Apollo program during the 1960s and 1970s.

### The F-1 Engine Powered Apollo Into History | NASA

The F-1 engine remains the highest thrust rocket engine that NASA has ever flown (1.5 million pounds of thrust). The liquid-fueled engine was used during the Apollo program and sat at the bottom of the Saturn V. The engines were designed to be disposable. After reaching a certain altitude, the engines would shut down and fall back into the ocean.

### F-1 Rocket Engine | National Air and Space Museum

It was used by NASA between 1967 and 1973. It was powered by five Rocketdyne F-1 engines. With a thrust of 1,746,000 lbf (7,770 kN) in vacuum (1,522,000 lbf / 6,770 kN at sea level), the F-1 remains the most powerful single combustion chamber liquid-propellant rocket engine ever developed. Today, private companies like SpaceX, Blue Origin, and space agencies like NASA trying to build powerful rockets in order to reach Moon and Mars.

If you are in the market for unbelievable performance in an affordable homebuilt airplane, the F1 Rocket is exactly the plane you've been looking for. This plane can outrun, outclimb, and outperform virtually all GA homebuilt aircraft. Able to climb at 3500 fpm, with a cruise speed over 230 kts, the F1 Rocket is a total performance machine. The F4 Raider is a virtually identical airframe, but uses a 4 cylinder Lycoming.
