Modeling and simulation (M&S) is the use of models (e.g., physical, mathematical, or logical representation of a system, entity, phenomenon, or process) as a basis for simulations to develop data utilized for managerial or technical decision making. In the computer application of modeling and simulation a computer is used to build a mathematical model which contains key parameters of the physical model.

Modeling and simulation (M&S) are attractive and widely used techniques for the study of the performance of computer networks. They provide detailed results without disturbing network operation or even without the need of network availability. This chapter summarizes the whole topic of performance M&S applied to computer networks.

Modeling and Simulation - an overview | ScienceDirect Topics

Computer simulation modeling is a discipline gaining popularity in both government and industry. Computer simulation modeling can assist in the design, creation, and evaluation of complex systems. Designers, program managers, analysts, and engineers use computer simulation modeling to understand and evaluate 'what if' case scenarios.

Computer Modeling and Simulation

In other words, modelling is creating a model which represents a system including their properties. It is an act of building a model. Simulation of a system is the operation of a model in terms of time or space, which helps analyze the performance of an existing or a proposed system. In other words, simulation is the process of using a model to study the performance of a system.

One technique used was discrete event computer simulation. The tools available for the approach were an IBM 650, assembly language, and a team of mathematician, a systems engineer and a programmer. The team accomplished less than half of what they were set to do, took twice as long and overspent the budget by a factor of two.

Types Dynamic simulations model changes in a system in response to (usually changing) input signals. Stochastic models use random number generators to model chance or random events; A discrete event simulation (DES) manages events in time. Most computer, logic-test and fault-tree simulations are ...

Computer simulation - Wikipedia

Modelling (modeling) and simulations are two closely related computer applications which play a major role in science and engineering today. They help scientists and engineers to reduce the cost and time consumption for research. They are also useful for ordinary people to understand and be trained for something easily.
