The steam-electric power station is a power station in which the electric generator is steam driven. Water is heated, turns into steam and spins a steam turbine which drives an electrical generator.After it passes through the turbine, the steam is condensed in a condenser.The greatest variation in the design of steam-electric power plants is due to the different fuel sources.

Steam-electric power station - Wikipedia

Conventional Energy Generation. The first practical electricity generating system using a steam turbine was designed and made by Charles Parsons in 1884 and used for lighting an exhibition in Newcastle. Since then, apart from getting bigger, turbine design has hardly changed and Parson's original design would not look out of place today.

Electricity Generation using Steam Turbines

Steam electricity is usually produced in a steam turbine generator that is an impulse or reaction turbine. The steam (high temperature water) needed to rotate the turbine and eventually be converted into electricity can come from many different sources. Water can be heated into steam using fossil fuels, nuclear power, or a renewable energy ...

Hi All; Been off grid now for over 30 years. Started out with solar and after moving a few miles I was able to develop a micro hydro setup that produces 120+ watts 24/7. Between the solar (if the sun shines) and the hydro I get most of the power we need. I do have a remote start generator that we use for high draw appliances and of course the inverter is recharging the battery's at the same ...
