The application of geometrical methods to thermodynamics is based on a thermodynamic phase space, i.e., a space spanned by a number of thermodynamic variables. In the CKC theory one considers a thermodynamic phase space spanned by such variables as pressure, volume, and the mole numbers of the chemical components.

This course emphasizes the application of thermodynamics to understand materials. It will focus on thermodynamic modeling of phase diagrams. The course seeks to teach students the application of thermodynamics on real problems, how to estimate where basic information is scarce and how to interpret thermodynamic information in the context of case studies.

Phase diagrams are graphical representations of the equilibrium relationships between minerals (or others phases). These relationships are governed by the laws of thermodynamics. Standard phase diagrams show how phases or phase assemblages change as a function of temperature, pressure, phase composition, or combinations of these variables.

## **Thermodynamics - Teaching Phase Equilibria**

The different phases of substances are characterized by different ranges of thermodynamic variables in which these phases are the stable phases. These ranges can be represented on a diagram in which two or more of the thermodynamic state variables are plotted against each other and these different regions are indicated, together with boundary lines separating them.

Thermodynamics is a branch of physics that deals with heat, work, and temperature, and their relation to energy, radiation, and physical properties of matter. The behavior of these quantities is governed by the four laws of thermodynamics which convey a quantitative description using measurable macroscopic physical quantities, but may be explained in terms of microscopic constituents by ...

thermodynamic state of  $P$  coexisting phases in a  $K$ -component system is  $F = K - 2P$  (Gibbs phase rule): The maximum number of coexisting phases is  $K - 2$ , which is realized for  $F = 0$ . In this case, no intensive variables need to be specified. All are determined by the conditions of phase coexistence.
