Diverse subtypes and developmental origins of trophoblast ...

Trophoblast giant cells (TGCs) are the first terminally differentiated subtype to form in the trophoblast cell lineage in rodents. In addition to mediating implantation, they are the main endocrine cells of the placenta, producing several hormones which regulate the maternal endocrine and immune systems and promote maternal blood flow to the implantation site.

SUBPOPULATIONS OF TROPHOBLAST. FUNCTIONAL ASPECTS. CT is the trophoblastic stem cell and is located on the villous surface. CT expresses epidermal growth factor receptor (EGF-R) which binds to EGF secreted by the decidua ().It has been postulated that paracrine-like mechanism EGF-R and its ligand may provide persistent growth stimulation for CT ().As discussed previously, CT differentiates ...

The cytotrophoblast (or layer of Langhans) is the inner layer of the trophoblast. It is interior to the syncytiotrophoblast and external to the wall of the blastocyst in a developing embryo. The cytotrophoblast is considered to be the trophoblastic stem cell because the layer surrounding the blastocyst remains while daughter cells differentiate and proliferate to function in multiple roles.

Cytotrophoblast - Wikipedia

The Trophoblast and the Origins of Cancer. Jed Stuber · Sep 21, 2010. ... The trophoblast then adeptly invades the mother's uterus, much as a cancer infiltrates host tissue of any organ, and it efficiently produces a dense blood supply—a requirement for any rapidly growing neoplasm

Trophoblast invasion is a critical process in the establishment of a successful pregnancy. But abnormal trophoblast invasion is associated with pathological conditions such as IUGR, stillbirth, spontaneous abortion, and preeclampsia. Trophoblasts constitutively express two isoforms of NOS (eNOS and iNOS), which produce NO in cells.

Trophoblast - an overview | ScienceDirect Topics

The syncytiotrophoblast forms an external layer without intercellular boundaries (syncytium) and its cells form cords infiltrating the endometrium. The syncytiotrophoblast derives from the fusion of cytotrophoblast cells. Through apoptosis (programmed cell death) of uterine stromal cells spaces are created through which the blastocyst penetrates further into the endometrium.

Objective and rationale: This review explores the origins and possible uses of trophoblast cells obtained during ongoing pregnancies (weeks 5-20) by TRIC. We hypothesize that endoglandular EVT cells at the margins of the expanding placenta enter the uterine cavity and are carried together with uterine secretion products to the cervix where they can be retrieved from a Papanicolaou (Pap) smear.

Trophoblast retrieval and isolation from the cervix ...

A comparative study of five physiological key parameters between four different human trophoblast-derived cell lines "Here, we present a comparative study on the functional aspects of the choriocarcinoma cell lines BeWo, JAR and Jeg-3, as well as the first trimester trophoblast cell line ACH-3P as placental in vitro barrier models for endocrine and transport studies.
